TENTATIVE SCHEDULE FOR NCSU HACKWORKS

Time	Planned Event
5:30 - 6	Contestants check in, teams are formed, and everyone is seated by 6
6- 6:30	Introductions, important announcement, explain events, pause for questions, welcome, keynote speaker + recognitions for partnering organizations
6:30-10	Comp begins, prompts given out, timer starts. Presentation + product has to be sent in by the end of the timer
10 - 10:30	Round robin judging (teams will be split so that they have more presentation time)
10:30 - 11	Judge deliberation, announce winners, closing speeches, etc

Why does this problem matter ?
Who is most affected?
Why does awareness currently fail ?
How will your solution change behavior ?
How can this scale?

Deliverable

- The problem
- The target user
- Your solution (demo or mockup)
- How it increases awareness
- How it drives measurable behavior change
- Why it is feasible
- Keep it realistic. Build an MVP

Pain Points:

- Many women are unaware of the effects of mixing birth control with other medications
    - Unknown (possibly negative) health effects are possible
- If women remain uninformed about the effects medication may have with their birth control, this can result in dangerously adverse health effects
- App is free

Solution:

- Offer a repository of information regarding what drugs negatively affect the body when being used alongside birth control, as well as

Target audience:

- Women 16-25 who are taking birth control in combination with other medications/drugs
- Ideal customer is college aged women
- Partner: planned parenthood

Committed outcome/customer value

- A majority of college women take birth control and at the same time they take painkillers to manage stress
- It matters because birth control is a very intense medication on your body, and taking others drugs at the same time could lead to detrimental effects
- Benefits: The customer can see risks in their current drug record and when they add new drugs to their intake, they can see the risk that comes with it to avoid harming their body (more)

Key Metrics:

- The value to our partner, planned parenthood, is that our tool provides a form of support for their target client of women seeking reproductive education and services.

- Our tool will bring awareness and inform (specifically) college-aged women about what medications can create health/reproductive problems while they are on birth control.
- Key success factors:
    - Positive reviews/ratings
    - Evidence of health improvement in clientele
    - Lower reports of hospitalization
    - Monthly questionaries, overall results are positive

Your solution

- Primary offering: Useful resources information

Specific public health issue: Sexual health (birth control)
Clear target community: College-aged women
Solution: Browser tool
Focus on awareness: Raises awareness to how medications may affect you adversely if you're on any sort of birth control (IUD, pills, injections), **empowers women to take agency over their MENSTRUAL HEALTH**. Maximize the healthy choices they can make in choosing safe medications given their situation.
Why does this problem matter? 47.2% of women ages 15-49 take some form of hormonal based contraceptive, given the pervasiveness of this in the target population, this is a pressing issue.
https://www.cdc.gov/nchs/products/databriefs/db539.h
The most affected population here is our target population: girls starting from early adolescence through their mid 20s.
https://pmc.ncbi.nlm.nih.gov/articles/PMC11491692/#:~:text=Table_title:%20Table%204:%20Table_content:%20header:%20%7C%20Reported,%7C%2020%E2%80%9325%20years%20(N=70):%2018.6%25%20(13)%20%7C

Current awareness efforts: Planned parenthood/ menstrual health campaigns focus more on the impact of the drugs. General contraindication checkers are often very wordy and have a high barrier to entry for reading.

Gap in knowledge: What are the contraindications of common birth controls with common medicines: pain killers, etc.

How will our solution change behavior: Ideally this solution would promote users to think more critically about the medicines they take alongside birth control, increasing their overall health and wellness.

How can this scale: As this expands, we hope that clinics will increase adoption and promote the app so that more women can be in control of their health as much as possible.

Why are we providing this product/ what differentiates this?
We provide ease of access and personalization of advice to the specific situation.

Here's the same outline without em dashes:

The Problem

- Many women (especially college-aged) take birth control alongside other medications like painkillers, antibiotics, supplements, and SSRIs without knowing the risks
- Contraindications are buried in fine print or require clinical knowledge to interpret
- Real consequences: reduced birth control effectiveness, hormonal disruption, or dangerous drug interactions
- No consumer-friendly, targeted tool exists to bridge this gap

---

The Target Community

- Women aged 16-25, particularly college students
- Likely taking oral contraceptives plus at least one other substance (OTC painkillers, prescribed medications, herbal supplements, recreational drugs)
- Tech-savvy, mobile-first, but underserved by clinical tools like Drugs.com
- Partner: Planned Parenthood (distribution channel and credibility)

Unique Value Proposition (UVP)

- "The only app built specifically for women on birth control to instantly flag medication risks in plain language, before they cause harm."
- Not a generic drug checker, personalized to their contraceptive type
- Designed for their age group: simple, visual, non-clinical language
- Backed by Planned Parenthood partnership for trust and reach

---

Your Solution (MVP)

- A mobile app with three core features:
    1. **My Medication Profile** - user logs their birth control type plus any other medications or supplements
    2. **Interaction Checker** - real-time risk flag when a new drug is added ("High Risk / Use Caution / Safe")

3. **Plain-Language Alerts** - explains why something is risky and suggests next steps (e.g., "Talk to your provider")

- MVP scope: iOS app, manual drug entry, database of the top 50 most common interactions with birth control

---

How It Increases Awareness

- Brings drug interaction education to the moment of need (when adding a new medication)
- Uses red/yellow/green visual risk indicators, no medical literacy required
- Push notifications for newly flagged interactions when a user's profile is updated
- In-app educational content (e.g., "Did you know ibuprofen plus hormonal birth control can raise blood pressure?")
- Planned Parenthood co-branding increases credibility and organic reach to the exact target demographic

---

How It Drives Measurable Behavior Change

- Track: % of users who view a risk alert and then remove or delay adding a flagged medication
- Track: # of users who tap "Talk to your provider" CTA after seeing a high-risk flag
- Track: repeat app opens (habit formation, logging new meds before taking them)
- Survey users at 30/60 days: "Have you changed a medication decision based on the app?"
- Partner with Planned Parenthood clinics to measure if patient-provider conversations about interactions increase

---

Why It Is Feasible

- Drug interaction data is publicly available (FDA, NIH DailyMed, Drugs.com API), no proprietary database needed
- MVP can be built as a simple React Native app with a curated interaction database (top 50 interactions covers the vast majority of real-world cases)
- Planned Parenthood partnership provides distribution without a large marketing budget
- No diagnosis or medical advice is given, the app flags and refers, reducing regulatory and liability risk
- A small team (1 developer, 1 designer, 1 health advisor) can ship an MVP in 8-12 weeks
-

Your birth control drug interaction website has strong monetization potential in the femtech space, especially avoiding worst-case risks like reduced efficacy or clots by educating users. Tailored to your marketing skills and Raleigh location, here are practical ways to earn from it as a side hustle or business.

Website Monetization

Launch with freemium access: free basic checks, premium subscriptions ($4.99/month) for personalized alerts, history tracking, and doctor export reports—like Flo Health's model generating recurring revenue. Add affiliate marketing via links to safe brands (e.g., Tylenol, pharmacies) or Nurx for birth control delivery, earning commissions on referrals.

Partnerships and Ads

Partner with women's health clinics, OBGYNs in Raleigh/NC State area, or apps like Bedsider for sponsored content or co-branded tools; offer white-label versions for their sites. Use targeted ads from pharma (e.g., non-interacting supplements) or anonymized data sales to researchers, ensuring HIPAA compliance.

Marketing Services Side Hustle

Freelance digital marketing on Upwork/Fiverr: promote your site while building client portfolios in women's health, charging $1,000–$5,000/month for SEO, social media, or email flows. Leverage your SKEMA background for luxury/fashion tie-ins, like content on cycle-syncing skincare.

Quick Starts in Raleigh

Use Wix/Shopify for an Etsy store selling digital guides (e.g., "Safe Meds Cheat Sheets") or event tie-ins like campus workshops at NC State on reproductive health. Aim for $1,000+/month initially via subscriptions and affiliates, scaling with your content creation skills.
